

# Create PDF Bookmarks

## Introduction

Thank you for your interest in our Create PDF Bookmarks Solution. This setup guide illustrates a simple example configuration. Please contact us by email to [info@oimaging.co.uk](mailto:info@oimaging.co.uk) if you have any questions

## Overview

The Create PDF Bookmarks plug-in uses an flexible syntax (which is applied in the barcode recognition settings) to recognize barcodes that match certain patterns (using Regular Expressions) and apply the bookmark at the point in the PDF document where the barcode appears. These pages can then be removed or retained in the finished PDF document.

## To Access The Settings

Start ScanToPDF

Click Edit->Click Options->Click the "Barcode Recognition" ICON->Click the "Action Script" TAB

## Syntax

The required syntax is

***SetBookmarkForCurrentPageIf***(*condition, path, title, IncludePageInOutputDocument*)

**condition** – a Boolean expression that equates to true or false

**path** – the path of the bookmark (used to create Multi-Level bookmarks)

**title** – the name of the bookmark when displayed

**IncludePageInDocument** – Boolean indicating whether the page with the bookmark barcode should be included in the finished PDF document

## Example

to create a top level (not nested) bookmark from a barcode of SDSAF and call the bookmark "Application Forms" leaving the bookmark page in the finished PDF document.

```
{SetBookmarkForCurrentPageIf(Regex.IsMatch(GetBarcodeText(),"SDSAF"),"\01Application Forms","Application Forms",true)}
```

Please note – bookmarks are sorted by the name of the path, this is why the 01 has been added to the path in this example.

To create additional bookmarks all you need to do is add additional syntax for each barcode/bookmark, for example

```
{SetBookmarkForCurrentPageIf(Regex.IsMatch(GetBarcodeText(),"SDSAF"),"\01Application Forms","Application Forms",true)}
```

```
{SetBookmarkForCurrentPageIf(Regex.IsMatch(GetBarcodeText(),"SDSDN"),"\02Decision Notice","Decision Notice",true)}
```

```
{SetBookmarkForCurrentPageIf(Regex.IsMatch(GetBarcodeText(),"SDSGC"),"\03Correspondence","General Correspondence",true)}
```

```
{SetBookmarkForCurrentPageIf(Regex.IsMatch(GetBarcodeText(),"SDSOR"),"\04Officers Report","Officers Report",true)}
```

```
{SetBookmarkForCurrentPageIf(Regex.IsMatch(GetBarcodeText(),"SDSPL"),"\05Plans","Plans",true)}
```

```
{SetBookmarkForCurrentPageIf(Regex.IsMatch(GetBarcodeText(),"SDSAP"),"\06Appeal","Appeal",true)}
```
